DESIGN A DESK CALCULATOR USING LEX TOOL

AIM:

To create a calculator that performs addition, subtraction, multiplication and division using lex tool.

ALGORITHM:

1. Initialize variables and declare a function prototype.
2. Define patterns for digits, arithmetic operations, and line breaks.
3. Implement lexical rules to perform actions based on matched patterns.
4. Define a function to convert tokens to floats and perform arithmetic operations.
5. Invoke lexical analysis in the main function.
6. Indicate the end of input with the yywrap() function.

PROGRAM:

```
%{
int op = 0,i;
float  a,  b;
int digi();
%}

dig [0-9]+|([0-9]*)"."([0-9]+)
add "+" sub "-" mul "*"
div "/"
pow "^"  ln
\n

%%

{dig} {digi();} {add}
{op=1;}
{sub} {op=2;}
{mul} {op=3;}
{div} {op=4;}
{pow} {op=5;}
{ln} {printf("\n The Answer :%f\n\n",a);}

%%

int digi() { if(op==0)
/* atof() is used to convert
        - the ASCII input to float */
a=atof(yytext); else{  b=atof(yytext);
```

Roll Number: 210701113

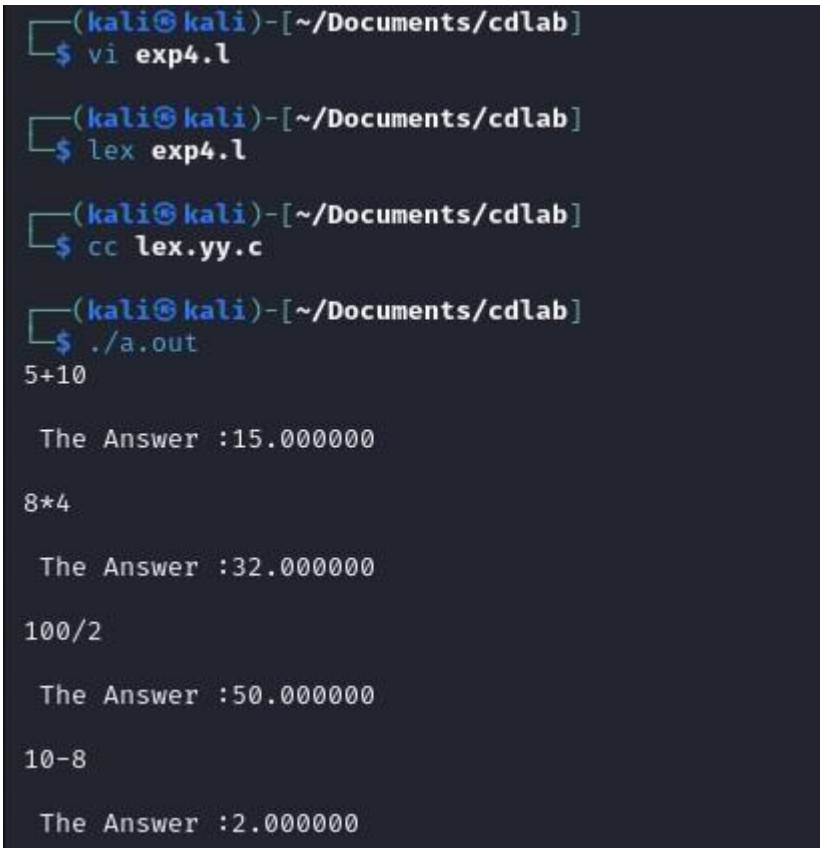
Name: Kavin chakravarthy

Exp No:

Date:

```
switch(op) { case 1:a=a+b; break;  case
2:a=a-b; break;             case 3:a=a*b;
break;  case
4:a=a/b; break;
case 5:for(i=a;b>1;b--) a=a*i;
break; } op=0; }
}  int main(int argv,char *argc[])
{  yylex();  }  int  yywrap()  {
return
1;
}
```

OUTPUT:



RESULT:

Thus, a calculator that performs addition, subtraction, multiplication and division using lex tool is implemented.
