IMPLEMENT CODE TO RECOGNIZE TOKENS IN C

AIM:

To implement the program to identify C keywords, identifiers, operators, end statements like [], {} using C tool.

ALGORITHM:

- 1. Start
- 2. Define functions to check if a character is a delimiter, operator, or a valid identifier.
- 3. Define functions to check if a given string is a keyword, integer, real number, or a valid identifier based on certain conditions.
- 4. Define a function to extract substrings from the input string based on delimiter positions.
- 5. Define a parsing function that iterates through the input string character by character and identify substrings delimited by spaces or operators.
- 6. Check each substring for being a keyword, integer, real number, or a valid identifier and print the corresponding message.
- 7. Define the main function.
- 8. Initialize a string with the input expression.
- 9. Call the parsing function with the input string.
- 10. Print the results of the parsing, indicating whether substrings are keywords, integers, real numbers, or valid identifiers.

PROGRAM:

```
#include <stdbool.h>
#include <stdio.h>
#include <stdio.h>
#include <stdlib.h> bool isDelimiter(char ch)

{ if (ch == '' || ch == '+' || ch == '-' || ch == '*' || ch == '/' || ch == ',' || ch == ';' || ch == '>' || ch == '<' || ch == '| ch == '|
```

```
|| ch == '=') return
 (true); return (false);
 bool validIdentifier(char* str)
 \{ \text{ if } (\text{str}[0] == '0' \parallel \text{str}[0] == '1' \parallel \text{str}[0] == '2' \parallel \text{str}[0] == '3' \}
           \| str[0] == '4' \| str[0] == '5' \| str[0] == '6' \| str[0]
                   == '7' \parallel str[0] == '8' \parallel str[0] == '9' \parallel
          isDelimiter(str[0]) == true) return (false);
          return (true);
 } bool isKeyword(char* str)

Roll Number: 210701113
```

Name: M Kavin chakravarthy

```
&& isDelimiter(str[right - 1]) == false) printf(""%s' IS NOT A VALID
IDENTIFIER\n", subStr); left = right;}}

return;}
int main(){
    // maximum length of string is 100 here
    printf("The expression is: float b= 0.5 * b;\n");
    char str[100] = "float b = 0.5 * b; ";

parse(str); // calling the parse function
return (0);
}
```

OUTPUT:

```
(kali@ kali)-[~/Documents/cdlab]
$ vi exp1.c

(kali@ kali)-[~/Documents/cdlab]
$ gcc exp1.c

(kali@ kali)-[~/Documents/cdlab]
$ ./a.out

The expression is: float b= 0.5 * b;'float' IS A KEYWORD
'b' IS A VALID IDENTIFIER
'=' IS AN OPERATOR
'0.5' IS A REAL NUMBER
'*' IS AN OPERATOR
'b' IS A VALID IDENTIFIER
```

Result:

Thus, a C program is implemented to identify C keywords, identifiers, operators and end statements.
